

PROVISIONAL PATENT APPLICATION

TITLE

DAWATRACK: Personalized Medicine Guardian

BACKGROUND

Field of the Invention:

The present invention is directed to a digital health solution for managing medication adherence and tracking using a web-based platform.

Description of the Related Art:

Currently available solutions for medication reminders include manual logs, basic alarm systems, and some web applications with limited functionality. These systems lack integrated modules for tracking medicine expiry, managing prescriptions, and securely storing user health data. Existing solutions also struggle with user engagement and scalability, and often do not cater to the specific needs of elderly or chronically ill patients.

SUMMARY

- To provide a web-based system that sends reminders for medication schedules.
- To enable tracking of medicine expiration dates to avoid consumption of expired drugs.
- To support digital storage and management of prescriptions and health check-up schedules.

BRIEF DESCRIPTION OF THE DRAWINGS

Fig.1 shows the flowchart of the DawaTrack web application outlining the major modules and their interaction.

Fig.2(a) illustrates the login page interface.

Fig.2(b) displays the signup page interface.

Fig.3 presents the main dashboard page of the application.

Fig.4 and Fig.5 show the user profile management page.

Fig.6 shows the medicine expiry reminder module.

Fig.7 illustrates the prescription management interface.

Fig.8 displays the check-up reminder module.

DETAILED DESCRIPTION

DawaTrack is a web-based application built using HTML, CSS, and JavaScript for the frontend and Supabase with PostgreSQL for the backend. The system allows users to create an account with secure authentication and manage their medicine schedules and records. The dashboard provides a user-friendly interface with features like:

- Medicine entry and expiry tracking.
- Prescription upload and storage.
- Check-up appointment scheduling and reminders.
- Secure data handling with HTTPS, password hashing, and session management.

The user interface is designed to be responsive across devices. Flowcharts outline the process of data entry, reminder setup, and database synchronization. The system enhances medication compliance and helps users, especially the elderly and chronically ill, to better manage their health routines.
