

1] DDL :- Data Definition Language

Data definition language is a category of SQL commands used to define, modify & manage the structure of database objects. It deals with the schema of the database rather than the actual data stored in it. DDL commands are responsible for creating, altering & deleting tables, view, indexes & constraints. When a DDL command is executed, the changes are automatically committed to the database, meaning they are permanent & cannot be rolled back in most cases.

Commands :-

CREATE - creates new db objects like tables, indexes.

```
CREATE TABLE Students (  
    student_id SERIAL PRIMARY KEY,  
    name TEXT NOT NULL  
);
```

ALTER - Modifies existing db object.

```
ALTER TABLE Students ADD COLUMN age INT;
```

DROP - Permanently deletes db objects.

```
DROP TABLE students;
```

TRUNCATE - Removes all rows.

```
TRUNCATE TABLE students;
```
