

4) **Aggregate views:**
Created using aggregate functions like COUNT, SUM, AVG, MIN & MAX. They provide summarized information instead of detailed rows.

5) **Materialized views:**
Unlike normal views, materialized views store the query result physically. They are used for performance improvement but require refresh mechanisms.

* Advantages:-

- 1) **Data security:** views can restrict access to sensitive columns while exposing only necessary data to user.
- 2) **Simplification:** They hide query complexity by encapsulating joins & filters.
- 3) **Reusability:** once defined, view can be reused in multiple queries.
- 4) **Data aggregation:** views can summarize data & present ~~an~~ analytical reports directly.
